Ultimately, the productivity and competitiveness of the machine tool and all of the supporting systems is dependant upon the experience, skill, expertise, knowledge, ingenuity, and capabilities of the manufacturing engineers, programmers, and skilled craftsmen. How they apply, operate, and supervise the various elements of the system makes the difference. This lavishly illustrated four-color book, written by Makino's Vertical Machining Center Product Line Manager, addresses not only the machine tool and its characteristics, but also these critical support technologies. The focus is on how to invest in technology that will supply maximum results for high-speed, hard milling applications. The text is structured to provide an easy flow, quick review for the reader, and yet still be used as a detailed reference. It is formatted in a 'question and answer' fashion, detailing what an owner, purchaser, or operator should know relative to making a machine tool investment specifically targeting high-speed, hard milling applications typical of the die and mold market.

This practical guide provides nearly 200 self-contained recipes to help you solve machine learning challenges you may encounter in your daily work. If you ' re comfortable with Python and its libraries, including pandas and scikit-learn, you ' ll be able to address specific problems such as loading data, handling text or numerical data, model selection, and dimensionality reduction and many other topics. Each recipe includes code that you can copy and paste into a toy dataset to ensure that it actually works. From there, you can insert, combine, or adapt the code to help construct your application. Recipes also include a discussion that explains the solution and provides meaningful context. This cookbook takes you beyond theory and concepts by providing the nuts and bolts you need to construct working machine learning applications. You ' ll find recipes for: Vectors, matrices, and arrays Handling numerical and categorical data, text, images, and dates and times Dimensionality reduction using feature extraction or feature selection Model evaluation and selection Linear and logical regression, trees and forests, and k-nearest neighbors Support vector machines (SVM), na ï ve Bayes, clustering, and neural networks Saving and loading trained models

The design patterns in this book capture best practices and solutions to recurring problems in machine learning. The authors, three Google engineers, catalog proven methods to help data scientists tackle common problems throughout the ML process. These design patterns codify the experience of hundreds of experts into straightforward, approachable advice. In this book, you will find detailed explanations of 30 patterns for data and problem representation, operationalization, repeatability, reproducibility, flexibility, explainability, and fairness. Each pattern includes a description of the problem, a variety of potential solutions, and recommendations for choosing the best technique for your situation. You'll learn how to: Identify and mitigate common challenges when training, evaluating, and deploying ML models Represent data for different ML model types, including embeddings, feature crosses, and more Choose the right model type for specific problems Build a robust training loop that uses checkpoints, distribution strategy, and hyperparameter tuning Deploy scalable ML systems that you can retrain and update to reflect new data Interpret model predictions for stakeholders and ensure models are treating users fairly
