The load-deflection analyses of flat and corrugated stainless steel diaphragms are performed to compare the sensitivity of the flat and corrugated diaphragm. The application of corrugated diaphragms offers the possibility to control the sensitivity of thin diaphragms by geometrical parameters. Depth of corrugations, thickness of diaphragms, and number of corrugations plays an important role to increase the mechanical sensitivity of the corrugated diaphragm.

The diaphragms used in this experiment are of two types. One is flat (planer) diaphragm and other is corrugated one. The material used for both the diaphragms is stainless steel (SS 304 ASTM-240). Flat circular diaphragm the size is 190 mm in diameter and 0.25 mm in thickness. For the

Most people that use both prefer the corrugated to the flat because by varying the pressure you can tune the diaphragm. A flat diaphragm actually sits below the rim of the stethoscope diaphragm, so when you contact the skin the first thing to touch is the anti-chill rim followed by the diaphragm.
