## Fuel Injection System In Komatsu

The Komatsu injection system is designed to form a fuel-air mixture by fuel injection. The fuel system works as follows. When the ignition is switched on, the fuel pump pumps the fuel into the system. When passing through the fuel filter, it is cleaned. Then the fuel enters the injection system, where the spraying and the formation of the fuel-air mixture occurs.

PDF Fuel Injection System In Komatsu Engine pump is one of the main components of the diesel engine injection system. The Komatsu pump, as a rule, performs two main functions: injecting a certain amount of fuel under pressure and regulation of the required timing of the injection. With the advent of battery injection systems, the injection timing control

The engine uses proven environment friendly technologies such as an exhaust gas aftertreatment system, an electronically-controlled cooled Exhaust Gas Recirculation (EGR) system, and an optimum fuel injection system using a common rail. These technologies, combined with Komatsu's own electronic control system, minimize environmental impact and improve fuel economy.

The system delivers fuel into a pre-chamber or pre-combustion chamber, where combustion begins and then spreads into the main combustion chamber. Direct injection in an internal combustion diesel engine, the fuel is injected directly into the combustion chamber, typically on the top of the piston which has a specially designed dome to aid in the controlled spread of combustion.

The system is designed to achieve an optimal injection of high-pressure fuel by means of computerized control, providing close-to- complete combustion to reduce PM emissions. The system uses high pressure injection, thereby reducing both PM emissions and fuel consumption over the entire range of engine operating conditions.
