Because marine engines are running hard most of the time, they require a lot of cooling. Boats that use external water cooling suck water into the cooling system through an inlet port under the boat or in the stern drive. A separate water pump pulls water in and routes it to a second water pump on the motor (mechanical or electric).

Quality of Cooling Water. The cooling water of the engine should be only demineralized (distilled) water with proper treatment, which is necessary for keeping effective cooling and preventing corrosion of the system. Though the distilled water matches best to the requirements for cooling water, it is necessary to add corrosion inhibitor. Because untreated distilled water absorbs carbon dioxide ...
