The ideal gas model is used to predict changes in four related gas properties: volume, number of particles, temperature, and pressure. Volumes of gases are usually described in liters, L, or cubic meters, m³, and numbers of particles are usually described in moles, mol. Although gas temperatures are often measured with thermometers that

The van der Waals equation is $(P + \frac{a}{V^2})(V - nb) = nRT$ where P = pressure V = volume a = pressure correction constant unique to the gas b = volume correction constant unique to the gas n = the number of moles of gas T = absolute temperature The van der Waals equation includes a pressure and volume correction to take into account the interactions between molecules. Unlike ideal gases, the individual particles of a real gas have interactions with each other and have definite volume.
